

• 2 soundings • 20 soundings • 200 soundings — one to one ● (e) unweighted ○ (e) weighted by count
 Every predicted value is out of fold, fitted on training blocks and predicted onto cells the fit never saw; in-sample values would be far more flattering, the spatial null's in-sample R^2 being 0.685 against its held-out 0.332. Panels share one pair of axis limits, so the flat clouds are flat and not merely stretched. Mark area is the sounding count on the composite figure's half-decade classes, because a cell's observed value is the mean of between 1 and 410 soundings. Land cover does not explain the observed field; see ERRATA.md 7.1. Wind is a reference and not an explanation: ERRATA.md 7.4 records that it is not attributable.
