

(a) NESDC rice, 2018**(b) share of each province**

■ mostly single season
 ■ mostly double season
 ■ classified, below 35%
 ■ not classified
 ■ sea

A 1/64° cell, about 1.4 km, is inked where at least 35% of it is rice, the threshold at which drawn area equals true area: 1.06 of 50,042 km². The season colour says which season a cell's rice mostly is, not how much — the two cannot share a threshold, area-matching at 0.35 and 0.17 — so the double colour covers 1,191 km² of a true 2,677; panel (b) has the areas. Unclassified is the product's own footprint: it does not cover the other provinces, and in Anhui it stops at 33.3462° N and 115.2682° E, a processing boundary and not an absence of rice.
