

**(a) from source to lattice**

**(b) from lattice to result**

Read (a) top-down and (b) left-right. Symbols are ISO 5807:1985's, from the set declared in src/figures/diagram.py: a parallelogram is data the reader must obtain, because data/raw/ is gitignored; a bowed rectangle is a file the clone already has; a rectangle with side bars is a named module under src/; a diamond is a decision, and every one of the 4 here is a refusal – the failing branch stops, and nothing is written or overwritten. Of 70 registered recipes, 39 rebuild from what a fresh clone holds, 21 need a fetched input and 9 need a network run. This is not a redrawing of the 2023 thesis's Figure 3.1: see ERRATA.md 4.1 and 3.3, and notes/repository-architecture.md for why no network was built.
