

(a) GAIA, first impervious**(b) GISA, first impervious****(c) four-province total**

impervious by 2000
 first 2001-2010
 first 2011-2019
 land below 25%
 sea

Maps show where, not how much: a $1/64^\circ$ cell, about 1.4 km, is inked where at least 25% of it had become impervious, which draws the 2000 class at 0.73 of its true area and the 2019 class at 1.30, so area is read from (c). Maps run to 2019, the last year both products cover; 2019 is the first year past GAIA's original 1985–2018 release and sits inside a stretch whose year-on-year growth drops from 7.1–10.5 % to 1.9–2.6 %, so it inherits that doubt. (c) keeps 2018, the year the thesis reported. Rice is drawn in its own figure; there is no methane equivalent, TROPOMI's footprint being 7 by 7 km with one usable year.
