

(a) GAIA, first impervious**(b) GISA, first impervious****(c) four-province total**

impervious by 2000
 first 2001-2010
 first 2011-2018
 land below 25%
 sea

Maps show where, not how much: a $1/64^\circ$ cell, about 1.4 km, is inked where at least 25% of it had become impervious, which draws the 2000 class at 0.73 of its true area and the 2018 class at 1.31, so area is read from (c). No rice panel: NESDC begins in 2017, Shanghai's and Jiangsu's totals are pinned across most of its record, and GloRice allocates statistics rather than observing extent. No methane panel: TROPOMI's footprint is 7 by 7 km and one year is usable.
