

**(a) from source to lattice**

**(b) from lattice to result**

Read (a) top-down and (b) left-right. Symbols are ISO 5807:1985's, from the set declared in `src/figures/diagram.py`: a parallelogram is data the reader must obtain, because `data/raw/` is gitignored; a bowed rectangle is a file the clone already has; a rectangle with side bars is a named module under `src/`; a diamond is a decision, and every one of the 4 here is a refusal – the failing branch stops, and nothing is written or overwritten. Of 52 registered recipes, 27 rebuild from what a fresh clone holds, 16 need a fetched input and 8 need a network run. This is not a redrawing of the 2023 thesis's Figure 3.1: see ERRATA.md 4.1 and 3.3, and `notes/repository-architecture.md` for why no network was built.
